HORIZONTAL DEFLECTION AMPLIFIER			
For operation in a 525-line, 30-frame system			
Maximum Ratings, Design-Center Values: DC PLATE VOLTAGE	-		
with no external shield. For plate volts = 115, grid-No.2 volts = 175, grid-No.1 volts = -20. For plate volts = 100, grid-No.2 volts = 100, grid-No.1 volts = -4.5. As described in "Standards of Good Engineering Practice Concerning Television Broadcast Stations", Federal Communications Commission. The duration of the voltage pulse must not exceed 15 per cent of one horizontal scanning cycle. In a 525-line, 30-frame system, 15 per cent of one horizontal scanning cycle is 10 microseconds. Under no circumstances should this absolute value be exceeded. Preferably obtained through a series dropping resistor of sufficient magnitude to limit the grid-No.2 input to the rated maximum value.

	▼ The dc component must not exceed 100 volts. ♠ For tube in vertical position with base down in free space and with natural ventilation, the hottest point on the bulb is in the center of the dome just above open end of cathode sleeve.
